ABSTRACT:

A tuning circuit for generating a digital code to be used to calibrate a capacitor array of the type used in active RC filters is comprised of a single-slope A/D converter with fixed reference voltages as inputs and an output value which is dependent on the RC product of a resistor and capacitor within the converter. A decoder converts the RC product as measured by the A/D converter into a digital code which, when applied to the appropriate capacitor array, sets the array capacitance to compensate for the difference between the measured RC product and the nominal design value.

9 Claims, 5 Drawing figures

Exemplary Claim Number: 1

Number of Drawing Sheets: 3

----- KWIC -----

Claims Text - CLTX (37):

when said circuit is in the second state, said switch connects said resistor to a fourth reference voltage, at least one of said switched capacitors in said capacitor array is enabled, and said amplifier, resistor, and said at least one enabled capacitor comprise an integrator having an RC time constant

defined by
said resistor and said at least one enabled capacitor, said integrator,
pulse
generator, counter, and decoder comprise said integrating tuner, said
digital
count indicating the magnitude of the RC time constant, said digital code
indicating which of said plurality of capacitors in said array is to be
enabled
when the circuit is in the first state so as to adjust the frequency
response
of said active RC filter in accordance with said RC time constant.
